# Contact Allergy

## Contact Allergy & Allergic Contact Dermatitis (ACD)

**Contact Allergy** is the result of specific immune responses caused by **antigens**. Unlike **allergens** (such as pollens and animal proteins) causing other forms of allergy, the culprits of Contact Allergies, **haptens**, are not antigens by themselves. Haptens (typically small, chemically reactive molecules with low molecular weight) need to penetrate the horny layer of the skin in order to conjugate to epidermal and dermal proteins forming “hapten-carrier complexes” with antigenic properties capable of causing **contact allergy**. Examples of widely recognized haptens include nickel, formaldehyde and other preservatives in cosmetics.

Contact allergy is the state of being sensitized to a hapten. Sensitization to a hapten occurs when the accumulated exposure to the hapten surpasses a certain threshold. This threshold is individual and varies greatly, some will develop an allergy the first time encountering the hapten while others withstand a life time of exposure without becoming sensitized. The prevalence of contact allergy to at least one hapten is around 20% in the general population<sup>1</sup>.

**Allergic Contact Dermatitis (ACD)** is a disease of the skin that can emerge in people that are exposed to specific haptens after having developed contact allergy to them. Once allergic, the subject might respond with skin inflammation (redness, flaking skin or blisters) whenever exposed. Individuals handling haptens as part of their profession run a higher risk of developing **ACD**. ACD accounts

for 20% of all reported work related skin diseases<sup>2</sup>. Occupational fields with high occurrences of ACD include (but are not limited to) hairdressing, construction work, cleaning and health care. Chronic once developed, and with no known cure, contact allergy is of major distress for those affected.

## Diagnosis

While contact allergy cannot be treated it can be diagnosed; by **Patch Testing** and not by **Skin Allergy Testing** (such as skin prick testing - used for the diagnosis of, for instance, respiratory allergies). Knowing what hapten is causing the allergic reactions helps the patient stay clear of that specific hapten, avoiding **ACD** and thereby effectively improving the quality of life for the individual.

The indication for Patch Testing is to **test all patients in whom contact allergy is suspected or needs to be ruled out**, regardless of age or anatomical site of dermatitis.

**Chemotechnique** provides all tools required to perform patch tests the IQ way - the gold standard for diagnosing contact allergy. In order to perform a diagnostic Patch Test, two crucial components are required; **Topical Haptens** and **Patch Test Units**.

## Topical Haptens

The hapten preparations used in patch testing should ideally be specifically developed for patch testing purposes. The Topical Haptens manufactured by Chemotechnique are standardized and prepared by mixing high purity fine particle ground raw material with an appropriate vehicle, such as high purity grade white petrolatum, using state of the art technology.

## Patch Test Units

To ensure that the hapten remains in direct contact with the skin for the time required (48h) to create a standardized controlled reaction, a Patch Test Unit is needed. A Patch Test Unit is composed of sets of chambers mounted on an adhesive tape. The purpose of the patch test chambers is to provide a defined area in which the skin will be exposed to the haptens during the testing.

## The IQ Chamber

The advanced IQ chamber is the result of many years of product development. The laminated tape/foam/filter paper construction results in a comfortable chamber that defines a test area and helps prevent leakage. The quadrate shape allows for easy differentiation between allergic and irritant reactions. This patch test chamber design is found in **IQ Ultra™**, **BasIQ Ultra™** and **IQ Ultimate™** Patch Test Units. The integrated filter papers make handling of loose filter papers redundant.

### Adhesive chamber rim

The medical grade acrylic adhesive helps prevent haptens leakage and enhances the adhesion.

### Foam frame for high comfort

The chambers are made of soft polyethylene foam for patient comfort.

### ABIETIC ACID

A-001	$C_{20}H_{30}O_2$	302.44
-------	-------------------	--------

Component in tall oil used as deodorizing agent in cooling fluids. Major component of rosin used in adhesive tapes, glues, inks, sealants, cosmetics, dental impression materials. **Cross:** **COLOPHONIUM, dihydroabietyl alcohol. CAS** 514-10-3.

### ACETAMINOPHEN

A-032	$C_8H_9NO_2$	151.16
-------	--------------	--------

Paracetamol or acetaminophen, is the active metabolite of phenacetin, a so-called coal tar analgesic. It is an effective substitute for acetylsalicylic acid, due to its analgesic (to relieve minor aches and pains) and antipyretic (to reduce fever) properties. However, unlike aspirin, it is not a very effective anti-inflammatory agent though it lacks many of the side effects of aspirin, and is available over-the-counter. Paracetamol is also useful in the management of more severe pain, where it allows lower dosages of additional non-steroidal anti-inflammatory drugs (NSAIDs) or opioid analgesics to be used, thereby minimizing overall side effects. It is a major ingredient in numerous cold and flu medications. **CAS** 103-90-2.

### Acetylsalicylic acid

A-031	$C_9H_8O_4$	180.16
-------	-------------	--------

Aspirin®, or acetylsalicylic acid, (acetosal) is a salicylate drug often used as an analgesic, antipyretic, and as an anti-inflammatory. It also has an antiplatelet ("blood-thinning") effect and is used long-term in low doses to prevent heart attacks and blood clot formation in people at high risk for developing blood clots. **CAS** 50-78-2.
