

K Laser Blue Derma

The first blue laser in the world which makes it possible to perform surgical and therapeutic treatments. High-technology is combined with the distinct characteristics of a 445 nm blue wavelength, which makes it possible to perform surgical treatments without bleeding, minimizing the risk of infections, and achieving an excellent aesthetic result. In synergy with the blue light, also 660 nm and 970 nm are used, as they provide support for superficial and deep biostimulation of tissues.

K-Laser Blue does not need maintenance; its consumables are low-cost and it enables one to work in maximum security. Moreover, K-Laser Blue is powerful, compact, light, transportable and its batteries are rechargeable. All surgical components can be sterilised. Also, K-Laser Blue technology is always updated thanks to its Wi-Fi connectivity.

K-laser blue derma, dynamic surgery, the ideal tool for the surgeon
